● Spline models

$$Y_{n \times 1} = X_{n \times p} \beta_{p \times 1} + \varepsilon_{n \times 1}$$

$$\hat{Y} = HY, \quad H = X(X^t X)^{-1} X^t$$

$$e = (I - H)Y$$

$$\|e\|^2 \sim \sigma^2 \chi_{n-p}^2$$

- Generally, if P is a projection onto a subspace \tilde{L} such that $P(X\beta) = 0$, then

$$\|PY\|^2 = \|P(X\beta + \varepsilon)\|^2 = \|P\varepsilon\|^2 \sim \sigma^2 \chi_{\dim \tilde{L}}^2.$$

R^2 for multiple regression

- Today
- Summary of last class
- R^2 for multiple regression
- Adjusted R^2
- Inference in multiple regression
- Testing $H_0 : \beta_2 = 0$
- Testing $H_0 : \beta_2 = 0$
- Some details
- Overall goodness of fit
- Dropping subsets
- General linear hypothesis
- Another fact about multivariate normal
- Polynomial models
- Polynomial models
- Spline models

$$SSE = \sum_{i=1}^n (Y_i - \hat{Y}_i)^2 = \|Y - \hat{Y}\|^2$$

$$SSR = \sum_{i=1}^n (\bar{Y} - \hat{Y}_i)^2 = \|\hat{Y} - \bar{Y}\mathbf{1}\|^2$$

$$SST = \sum_{i=1}^n (Y_i - \bar{Y})^2 = \|Y - \bar{Y}\mathbf{1}\|^2$$

$$R^2 = \frac{SSR}{SST}$$

Adjusted R^2

- Today
- Summary of last class
- R^2 for multiple regression
- Adjusted R^2
- Inference in multiple regression
- Testing $H_0 : \beta_2 = 0$
- Testing $H_0 : \beta_2 = 0$
- Some details
- Overall goodness of fit
- Dropping subsets
- General linear hypothesis
- Another fact about multivariate normal
- Polynomial models
- Polynomial models
- Spline models

- As we add more and more variables to the model – even random ones, R^2 will go to 1.
- Adjusted R^2 tries to take this into account by replacing sums of squares by “mean” squares

$$R_a^2 = 1 - \frac{SSE/(n-p)}{SST/(n-1)} = 1 - \frac{MSE}{MST}.$$

- Here is an example.

Inference in multiple regression

- Today
- Summary of last class
- R^2 for multiple regression
- Adjusted R^2
- Inference in multiple regression
- Testing $H_0 : \beta_2 = 0$
- Testing $H_0 : \beta_2 = 0$
- Some details
- Overall goodness of fit
- Dropping subsets
- General linear hypothesis
- Another fact about multivariate normal
- Polynomial models
- Polynomial models
- Spline models

- F -statistics.
- Dropping a subset of variables.
- General linear hypothesis.

Testing $H_0 : \beta_2 = 0$

- Today
- Summary of last class
- R^2 for multiple regression
- Adjusted R^2
- Inference in multiple regression
- Testing $H_0 : \beta_2 = 0$
- Testing $H_0 : \beta_2 = 0$
- Some details
- Overall goodness of fit
- Dropping subsets
- General linear hypothesis
- Another fact about multivariate normal
- Polynomial models
- Polynomial models
- Spline models

- Can be tested with a t -test:

$$T = \frac{\hat{\beta}_2}{SE(\hat{\beta}_2)}.$$

- Alternatively, using an F -test with a “full” and “reduced” model

- ◆ (F) $Y_i = \beta_0 + \beta_1 X_{i1} + \beta_2 X_{i2} + \varepsilon_i$
- ◆ (R) $Y_i = \beta_0 + \beta_1 X_{i1} + \varepsilon_i$

- F -statistic: under $H_0 : \beta_2 = 0$

$$SSE_F = \|Y - \hat{Y}_F\|^2 \quad \sim \sigma^2 \chi_{n-3}^2$$

$$SSE_R = \|Y - \hat{Y}_R\|^2 \quad \sim \sigma^2 \chi_{n-2}^2$$

$$SSE_F - SSE_R = \|\hat{Y}_F - \hat{Y}_R\|^2 \quad \sim \sigma^2 \chi_1^2$$

and $SSE_F - SSE_R$ is independent of SSE_F (see details).

Testing $H_0 : \beta_2 = 0$

- Today
- Summary of last class
- R^2 for multiple regression
- Adjusted R^2
- Inference in multiple regression
- Testing $H_0 : \beta_2 = 0$
- Testing $H_0 : \beta_2 = 0$
- Some details
- Overall goodness of fit
- Dropping subsets
- General linear hypothesis
- Another fact about multivariate normal
- Polynomial models
- Polynomial models
- Spline models

■ Under H_0

$$F = \frac{(SSE_F - SSE_R)/1}{SSE_F/(n-3)} \sim F_{1,n-3}.$$

■ Reject H_0 at level α if $F > F_{1,n-3,1-\alpha}$.

Some details

- Today
- Summary of last class
- R^2 for multiple regression
- Adjusted R^2
- Inference in multiple regression
- Testing $H_0 : \beta_2 = 0$
- Testing $H_0 : \beta_2 = 0$
- Some details

- Overall goodness of fit
- Dropping subsets
- General linear hypothesis
- Another fact about multivariate normal
- Polynomial models
- Polynomial models
- Spline models

- $SSE_F \sim \sigma^2 \chi_{n-3}^2$ if the full model is correct, and $SSE_R \sim \sigma^2 \chi_{n-2}^2$ if H_0 is correct because

$$H_F Y = H_F (X\beta + \varepsilon) = X\beta + H_F \varepsilon$$

$$H_R Y = H_R (X\beta + \varepsilon) = X\beta + H_R \varepsilon \quad (\text{under } H_0)$$

If H_0 is false SSE_R is σ^2 times a non-central χ_{n-2}^2 .

- Why is $SSE_R - SSE_F$ independent of SSE_F ?

$$\begin{aligned} SSE_R - SSE_F &= \|Y - H_R Y\|^2 - \|Y - H_F Y\|^2 \\ &= \|H_R Y - H_F Y\|^2 \quad (\text{Pythagoras}) \\ &= \|H_R \varepsilon - H_F \varepsilon\|^2 \quad (\text{under } H_0) \end{aligned}$$

$(H_R - H_F)\varepsilon$ is in L_F , the subspace of the full model while $e_F = (I - H_F)\varepsilon$ is in L_F^\perp the orthogonal complement of the full model – therefore e_F is independent of $(H_R - H_F)\varepsilon$.

Overall goodness of fit

- Today
- Summary of last class
- R^2 for multiple regression
- Adjusted R^2
- Inference in multiple regression
- Testing $H_0 : \beta_2 = 0$
- Testing $H_0 : \beta_2 = 0$
- Some details
- Overall goodness of fit
- Dropping subsets
- General linear hypothesis
- Another fact about multivariate normal
- Polynomial models
- Polynomial models
- Spline models

■ Testing

$$H_0 : \beta_1 = \beta_2 = 0.$$

■ Two models:

- ◆ (F) $Y_i = \beta_0 + \beta_1 X_{i1} + \beta_2 X_{i2} + \varepsilon_i$
- ◆ (R) $Y_i = \beta_0 + \varepsilon_i$

■ F -statistic, under H_0 :

$$F = \frac{(SSE_R - SSE_F)/2}{SSE_F/(n-3)} = \frac{\|(H_R - H_F)Y\|^2/2}{\|(I - H_F)Y\|^2/(n-3)} \sim F_{2,n-3}.$$

■ Reject H_0 if $F > F_{1-\alpha,2,n-3}$.

■ Details: same as before.

Dropping subsets

- Today
- Summary of last class
- R^2 for multiple regression
- Adjusted R^2
- Inference in multiple regression
- Testing $H_0 : \beta_2 = 0$
- Testing $H_0 : \beta_2 = 0$
- Some details
- Overall goodness of fit
- Dropping subsets
- General linear hypothesis
- Another fact about multivariate normal
- Polynomial models
- Polynomial models
- Spline models

■ Suppose we have the model

$$Y_i = \beta_0 + \beta_1 X_{i1} + \cdots + \beta_{p-1} X_{i,p-1} + \varepsilon_i$$

and we want to test whether we can simplify the model by dropping variables, i.e. testing

$$H_0 : \beta_{j_1} = \cdots = \beta_{j_k} = 0.$$

■ Two models:

- ◆ (F) – above
- ◆ (R) – model with columns X_{j_1}, \dots, X_{j_k} omitted from the design matrix.

■ Under H_0

$$F = \frac{(SSE_R - SSE_F) / (df_R - df_F)}{SSE_F / df_F} \sim F_{df_R - df_F, df_F}$$

where df_F and df_R are the “residual” degrees of freedom of the two models.

General linear hypothesis

- Today
- Summary of last class
- R^2 for multiple regression
- Adjusted R^2
- Inference in multiple regression
- Testing $H_0 : \beta_2 = 0$
- Testing $H_0 : \beta_2 = 0$
- Some details
- Overall goodness of fit
- Dropping subsets
- General linear hypothesis
- Another fact about multivariate normal
- Polynomial models
- Polynomial models
- Spline models

- In previous slide: we had to fit two models, and we might want to test more than just whether some coefficients are zero.

- Suppose we want to test

$$H_0 : C_{k \times p} \beta_{p \times 1} = h_{k \times 1}$$

Specifying the reduced model can be difficult.

- Under H_0

$$C\hat{\beta} - h \sim N(0, \sigma^2 C(X^t X)^{-1} C^t).$$

- As long as $C(X^t X)^{-1} C^t$ is invertible

$$(C\hat{\beta} - h)^t (C(X^t X)^{-1} C^t)^{-1} (C\hat{\beta} - h) = SSE_R - SSE_F \sim \sigma^2 \chi_k^2.$$

- F -statistic

$$F = \frac{(SSE_F - SSE_R) / (df_R - df_F)}{SSE_F / df_F} \sim F_{df_R - df_F, df_F}.$$

Another fact about multivariate normal

- Today
- Summary of last class
- R^2 for multiple regression
- Adjusted R^2
- Inference in multiple regression
- Testing $H_0 : \beta_2 = 0$
- Testing $H_0 : \beta_2 = 0$
- Some details
- Overall goodness of fit
- Dropping subsets
- General linear hypothesis
- Another fact about multivariate normal
- Polynomial models
- Polynomial models
- Spline models

- Suppose that $Z_{k \times 1} \sim N(0, \Sigma_{k \times k})$ where Σ is invertible. Then

$$Z^t \Sigma^{-1} Z \sim \chi_k^2.$$

- Why? Let $\Sigma^{-1/2}$ be a square root of Σ^{-1} , i.e. $\Sigma^{-1/2}$ is a symmetric matrix such that

$$\Sigma^{-1/2} \Sigma \Sigma^{-1/2} = I_{k \times k}$$

$$\Sigma^{-1/2} \Sigma^{-1/2} = \Sigma^{-1}.$$

- Then,

$$\Sigma^{-1/2} Z \sim N(0, I_{k \times k})$$

and

$$Z^t \Sigma^{-1} Z = \|\Sigma^{-1/2} Z\|^2 \sim \chi_k^2.$$

Polynomial models

- Today
- Summary of last class
- R^2 for multiple regression
- Adjusted R^2
- Inference in multiple regression
- Testing $H_0 : \beta_2 = 0$
- Testing $H_0 : \beta_2 = 0$
- Some details
- Overall goodness of fit
- Dropping subsets
- General linear hypothesis
- Another fact about multivariate normal
- Polynomial models
- Polynomial models
- Spline models

- So far, we have considered models that are *linear* in the x 's.
- We could have regression model be linear in *known* functions of x : example polynomials.

$$Y_i = \beta_0 + \beta_1 X_i + \beta_2 X_i^2 + \cdots + \beta_k X_i^k + \varepsilon_i.$$

- Here is an example.

Polynomial models

- Today
- Summary of last class
- R^2 for multiple regression
- Adjusted R^2
- Inference in multiple regression
- Testing $H_0 : \beta_2 = 0$
- Testing $H_0 : \beta_2 = 0$
- Some details
- Overall goodness of fit
- Dropping subsets
- General linear hypothesis
- Another fact about multivariate normal
- Polynomial models
- Spline models

- Caution should be used in degree of polynomial used: it is easy to overfit the model.
- Useful when there is reason to believe relation is nonlinear.
- Easy to add polynomials in more than two variables to the regression: *interactions*.
- Although polynomials can approximate any continuous function (Bernstein's polynomials) there are sometimes better bases. For instance, regression model may not be polynomial, but only “piecewise” polynomial.
- Design matrix X can become ill-conditioned which can cause numerical problems.

Spline models

- Today
- Summary of last class
- R^2 for multiple regression
- Adjusted R^2
- Inference in multiple regression
- Testing $H_0 : \beta_2 = 0$
- Testing $H_0 : \beta_2 = 0$
- Some details
- Overall goodness of fit
- Dropping subsets
- General linear hypothesis
- Another fact about multivariate normal
- Polynomial models
- Polynomial models
- Spline models

- Splines are piecewise polynomials functions, i.e. on an interval between “knots” (t_i, t_{i+1}) the spline $f(x)$ is polynomial but the coefficients change within each interval.
- Example: cubic spline with knots at $t_1 < t_2 < \dots < t_h$

$$f(x) = \sum_{j=0}^3 \beta_{0j} x^j + \sum_{i=1}^h \beta_i (x - t_i)_+^3$$

where

$$(x - t_i)_+ = \begin{cases} x - t_i & \text{if } x - t_i \geq 0 \\ 0 & \text{otherwise.} \end{cases}$$

- Here is an example.
- Conditioning problem again: B -splines are used to keep the model subspace the same but have the design less ill-conditioned.
- Other bases one might use:
 - ◆ Fourier: sin and cos waves.
 - ◆ Wavelet: space/time localized basis for functions
